“Translations of the original instructions”

INTRODUCTION

First of all we wish to thank you for choosing to use a **TECSYSTEM** product and recommend you read this instruction manual carefully: You will understand the use of the equipment and therefore be able to take advantage of all its functions.

ATTENTION! THIS MANUAL IS VALID AND COMPLETE FOR THE NT538 ETH CONTROL UNIT

SAFETY REQUIREMENTS

ATTENTION :

Carefully read the manual before starting using the control unit. Keep the instructions for future reference.

Do not open the device, touching any internal component can result in electric shock as voltages over 50 volts can be lethal. In order to reduce the risk of electric shock, do not disassemble the back of the device. Warranty shall be void if device is opened.

Before connecting the device to the power supply, ensure that all the connections are correct. Always disconnect the unit from the supply before making any modification on the wiring.

Any operation on the equipment must be operated by a qualified technician.

Failure to comply with these instructions can cause damages, fires or electric shock, and possible serious injuries!

POWER SUPPLY

The NT538 ETH control unit has UNIVERSAL power supply, i.e. it can be supplied from 85 to 260 Vac-Vdc, irrespectively of polarity in Vdc. Before use, ensure that the power cable is not damaged, knotted or pinched. Do not tamper with the power cable. Never disconnect the unit by pulling the cable, avoid touching the clamps. Do not carry out any connecting/disconnecting operation with wet hands. To disconnect the device, do not use objects such as levers. Immediately disconnect the device if you smell burning or see any smoke: contact technical service.

LIQUIDS

Do not expose the equipment to liquid spurts or drops, do not position it in places where humidity exceeds 90% and never touch it with wet or humid hands during storms. If any liquid penetrates the control unit, disconnect immediately and contact technical service.

CLEANING

Disconnect the power cable before cleaning the control unit, using a dry cloth without any solvent or detergent, and compressed air.

OBJECTS

Never insert objects into the openings of the control unit. If this happens, disconnect the control unit and contact technical service.

USE RESERVED TO QUALIFIED PERSONNEL

The purchased good is an advanced electronic device that should not be used by non-qualified personnel. Any operation must be carried out by a qualified technician.

ACCESSORIES

The use of non-original accessories or spare parts may damage the unit and endanger users' safety. In event of fault, contact technical service.

LOCATION

Install the control unit indoor, in a place protected from water splashes and sun rays. Do not place near heat sources if exceeding the parameters stated in this manual. Position on a stable surface, far from any possible vibrations. Position the unit as far as possible from intense magnetic fields..

REPAIRS

Do not open the control unit. In case of fault, always contact qualified personnel. The opening of the control unit and/or the removal of the series identifying label automatically make the warranty void. The warranty seal is applied to all devices, any attempt to open the unit would cause the seal to break the consequent automatic cancellation of the warranty.

FUNCTION

To control the transformer correctly from a temperature point of view, enabling the VOTING function is allowed where the load distributed between the phases of the transformer is adequately balanced.

TECHNICAL INFORMATION

Mail: ufficiotecnico@tecsystem.it — tel: 02/4581861

ACCESSORIES

The following objects are present inside the box:

Control unit

Start guide and QR code

2 blocks for panel mounting

1 supply terminal 3 poles pitch 5
Code: 2PL0367- Screws tightening torque 0.5Nm

1 relay terminal 12 poles pitch 5
Code: 2PL0361- Screws tightening torque 0.5Nm

2 Pt100 sensor terminal 12 poles pitch 3.81
Code: 2PL0430 - Screws tightening torque 0.25Nm

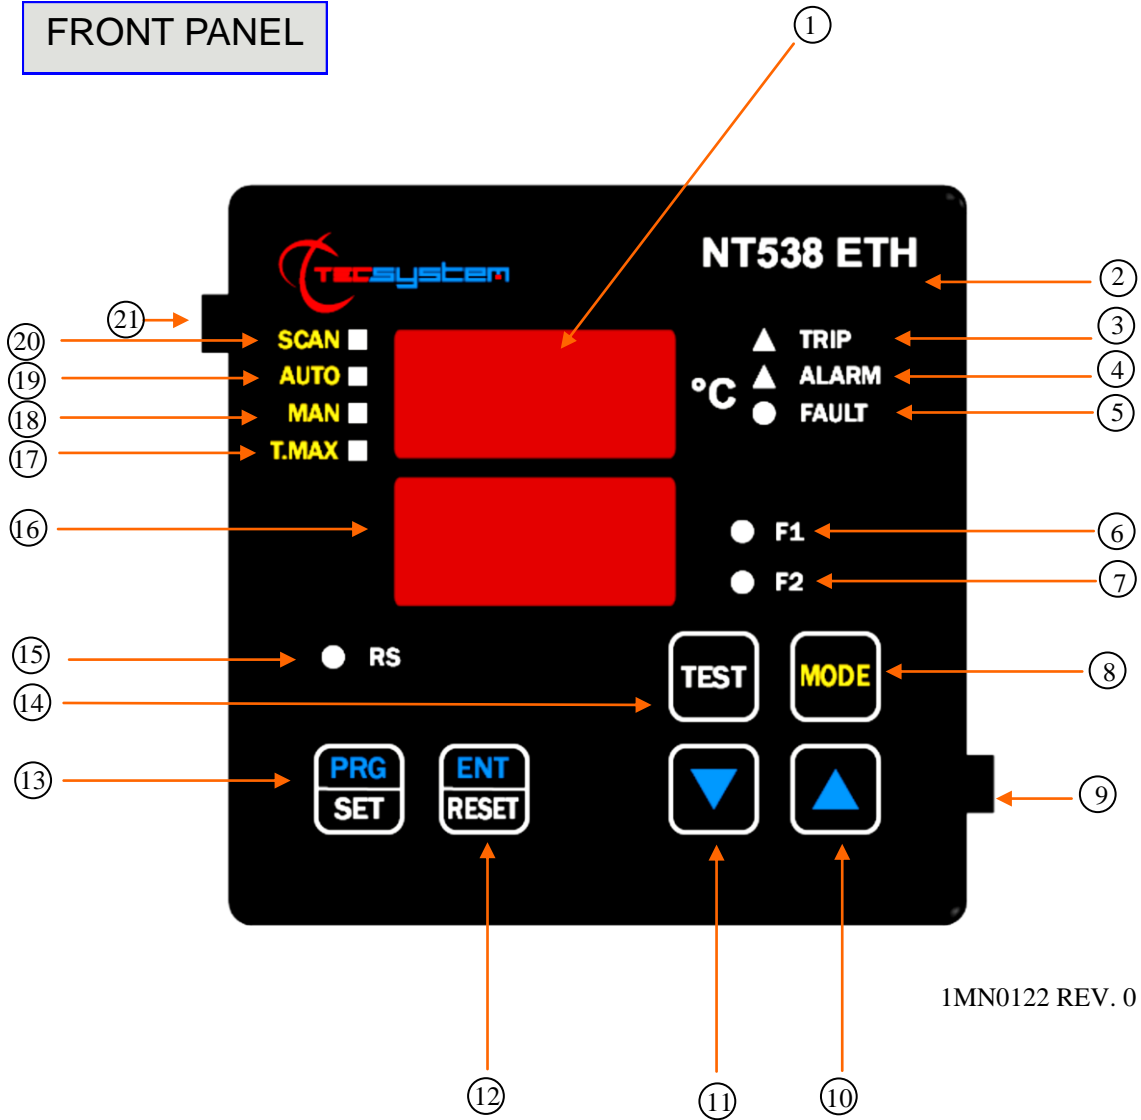

ATTENTION: always install the device using the terminals included in the pack.
The use of terminals other than those included with the control unit might cause malfunctions.

TECHNICAL SPECIFICATIONS	NT538 ETH
POWER SUPPLY	
Supply rated values	85-260 Vac-Vdc 50/60HZ
Vdc with reversible polarities	•
INPUTS	
8 inputs for RTD sensors, Pt100 type with 3 wires (max section 1.5mm ²)	•
Connections on removable terminal strips	•
Input channels protected against electromagnetic interference	•
Cable compensation for thermistors	500m (1mm ²)
OUTPUTS	
2 alarm relays (ALARM AND TRIP) SPDT	•
1 sensor or operating failure (FAULT) relay SPST	•
Output relays with 10A-250Vac-res COS Φ =1 contacts.	•
2 ventilation management relays SPST FAN 1 AND FAN 2	•
Ethernet output 10Base T / 100Base-TX Modbus TCP slave.	•
DIMENSIONS	
100x100 mm– din43700-depth 131mm (terminal block included)	Hole 92 x 92 mm
TESTS AND PERFORMANCE	
Construction in compliance with CE regulations	•
Protection from electrical interference EN 61000-4-4	•
Dielectric strength 1500 Vac for a min. between output relays and sensors, relays and power supply, power supply and sensors	•
Accuracy $\pm 1\%$ v/s, ± 1 digit	•
Ambient operating temperature from -20°C to $+60^{\circ}\text{C}$	•
Humidity 90% non-condensing	•
Front polycarbonate IP65	•

TECHNICAL SPECIFICATIONS	NT538 ETH
Housing NORYL 94 _V0	•
Absorption 7,5VA	•
Data memory 10 years minimum	•
Digital linearity of sensor signal	•
Self-diagnostic circuit	•
Protection treatment of the electronic part	Option
DISPLAY AND DATA MANAGEMENT	
2x13mm displays with 3 digits to display temperatures, messages and channels	•
3 LEDs to display the state of the alarms of the selected channel (ALARM-TRIP-FAULT)	•
4 leds selection of display mode (SCAN-AUTO-MAN-T-MAX)	•
2 LEDs to display the state of FAN1 and FAN2	•
Temperature control from 0°C to 240°C (*)	•
1 alarm thresholds for each channels	•
1 Trip thresholds for each channels	•
2 ON-OFF thresholds for FAN 1 and FAN 2 in common for all enabled channels	•
Sensor diagnostics (Fcc-Foc-Fcd)	•
Data memory diagnostics (Ech)	•
Access to programming through front keyboard	•
Automatic exit from relay programming, display and test after 1 minute's inactivity	•
Incorrect programming warning	•
Selection between channel automatic scanning, hottest channel or manual scanning	•
Storage of maximum temperatures reached by channels and alarm status	•
Front key to reset the alarms	•
Voting function	•
Fail Safe function	•

(*) On demand, available version from -40°C to 200°C with alarm temperature management range from 0°C to 200°C

FRONT PANEL

1MN0122 REV. 0

1)	3-digit temperature display	12)	Enter/Reset button
2)	Control unit series	13)	Programming / Setting key
3)	TRIP (red) LED	14)	LED/relay test key
4)	ALARM (yellow) LED	15)	RS (green) LED
5)	FAULT (red) LED	16)	3-digit channel display
6)	FAN 1 (yellow) LED	17)	T-max mode selection (red) LED
7)	FAN 2 (yellow) LED	18)	Man mode selection (yellow) LED
8)	Display mode selection key	19)	Auto mode selection (green) LED
9)	Fixing block	20)	Scan mode selection (yellow) LED
10)	UP key	21)	Fixing block
11)	DOWN key		

DISPLAY

The first display is dedicated to temperatures.

The second display to the monitored channel.

When the device is switched on or following a reset, the display shows the control unit model, NT538 ETH, together with VER "00" (firmware version) and temperature range of the unit.

Pressing the MODE key, the display modes can be set:

- **SCAN:** the monitoring unit displays all the activated (°C) and deactivated (NO) channels scanning every 2 seconds.
- **AUTO:** the monitoring unit displays the hottest channel automatically.
- **MAN:** manual reading of the channel temperature using the up/down keys ▲▼
- **T.MAX:** the monitoring unit displays the highest temperature reached by the sensors and any situation of: alarm or fault occurred after the last reset. Select channels with cursors▲▼, reset values with RESET.

OPERATING PROGRAM CONTROL

To control the protection levels programmed, press the PRG key twice to access the **VIS** display mode. By repeatedly pressing the PRG key, you can scroll through all the previously loaded values in sequence. After 1 minute's keyboard inactivity, the programming display procedure is automatically abandoned.

To stop the display, press the ENT key.

NOTES ON SCAN AND MAN FUNCTIONS

During the SCAN and MAN modes, the operation of the NT538 can be displayed.

1) RUN CPU:

This message appears when the unit operates regularly without any system error.

2) Ech Err:

This message appears when a damage in the EEPROM memory is detected.

Pressing Reset will cancel the message and restore the original default parameters, listed in the programming paragraph on pages 13-14. Return the control unit to TECSYSTEM for repairs.

3) CAL Err:

This message appears when damage is found in the measurement circuit.

The temperature values displayed might be incorrect. Return the control unit to TECSYSTEM for repairs.

4) Pt Err :

This message appears when it is detected that one or more PT100 sensors are not working correctly, FOC, FCC and FCD indications in the temperature sensor diagnostics paragraph on page 16. In case of **Err** the FAULT relay will be de-energised.

The above messages will be displayed following the 1-2-3-4 priority stated.

NOTE: regardless of the display mode, in case of a sensor fault (fcc, foc or fcd), the control unit will automatically switch to **SCAN (PRIVILEGED SCAN)** mode, immediately allowing you to see the fault on the relative channel **CH**. (**Mode** key is disabled).

LED TEST

We suggest carrying out the control unit LED test regularly.

For this operation, press the TEST key briefly; all the displays turn on for 2 seconds.

If one of the LEDS does not work, please return the control unit to TECSYSTEM for repair.

ALARM RELAY TEST

This function allows you to carry out a test of the relay operation without having to use further devices. To start the test procedure, keep the TEST button pressed for about 5 seconds: TST appears for 2 seconds, confirming you have entered the Relay Test mode.

The LED that is lit shows the relay to be tested; use the cursors ▲▼ to select the desired relay.

Press the SET and RESET keys to energise and de-energise the relay to be tested; the display will show ON-OFF.

After 1 minute's keyboard inactivity, the RELAY TEST procedure will be automatically abandoned.

To stop the RELAY TEST procedure, press the TEST key.

Alternatively, you can use the PT100 simulator model: SIM PT100.

ALARM RELAY SILENCING

If you want to silence the ALARM signal press the RESET key: the relay de-energises and the ALARM LED, which was fixed, will start flashing. Silencing is automatically disabled when the temperature goes below the ALARM threshold.

MOUNTING

Drill a 92 x 92 mm hole in the panel sheet.

1MN0007 REV. 0

1)	Control unit	2)	Panel hole dimensions (+0.8mm tolerance)
3)	Identification label		

Fix the unit securely with the blocks supplied.

1MN0008 REV. 0

1)	Control unit	3)	Fixing screw
2)	Fixing block	4)	Cross-head screwdriver #1X100mm

ELECTRICAL CONNECTIONS

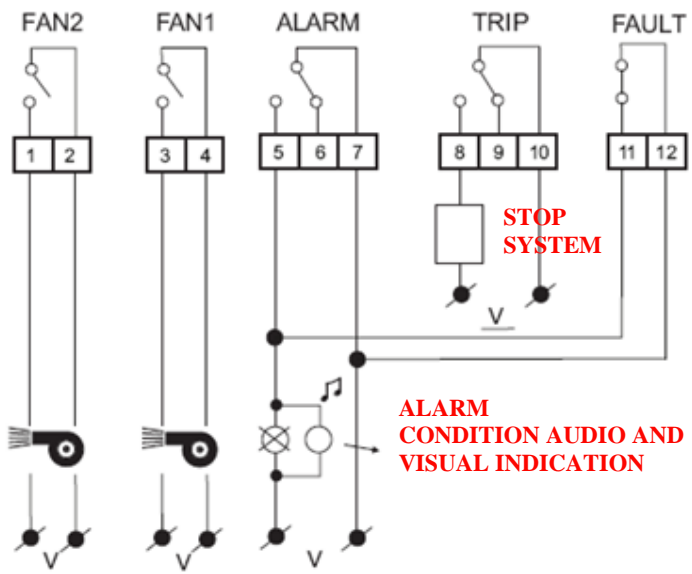

NT538 ETH

1)	Pt100 sensors (white-red-red)	3)	Relays (FAN2-FAN1-ALARM-TRIP-FAULT)
2)	Supply 85-260Vac-dc 50/60Hz.	4)	RJ45 Ethernet output, Link-Activity LED, see indication on page 30.

Note: relay contact image in non-alarm condition, with the exception of the FAULT relay that opens: contact 11-12 open (NO) contacts 11-12 closed (NC) fault condition identification. Read the Alarms and Ventilation paragraph on page 12 and see the opening of the fault contact.

RELAY CONNECTION EXAMPLE

Pt100 CONNECTION EXAMPLE

!
Note: before connecting the sensors to the control unit, read the Measurement signal transfer paragraph on page 15.

Output relay with 10A-250Vac-res COS Φ =1 contacts.

1MN0095 REV. 0

POWER SUPPLY

The NT538 ETH control unit has UNIVERSAL power supply, i.e. it can be supplied by 85 to 260 Vac-Vdc, 50/60 Hz irrespectively of polarity in Vdc (terminals 40-42).

This is obtained thanks to the use of a tested power supply unit, newly designed and manufactured, that frees installers from worrying about the correct Vac and Vdc supply.

The ground must always be connected to terminal 41.

When the unit is supplied directly by the secondary of the transformer to protect, it can be burnt out by strong overvoltages.

This happens if the main switch is closed and the transformer has no load (blank test).

The above-mentioned problems are much more evident when the 220 Vac voltage is taken directly from the transformer secondary bars and there is a fixed capacitor battery to phase the transformer itself.

To protect the control unit from line overvoltages, we suggest using the PT-73- 220 electronic discharger, designed by TECSYSTEM S.r.l. for this specific purpose. As an alternative we suggest using 110 Vac or, even better, 110 Vdc supply voltages.

If an existing control unit must be replaced with a new one, to guarantee its correct and safe operation, the sensor/relay/supply connecting terminals must be replaced with the new terminals supplied.

ALARMS AND VENTILATION

Carry out the electrical connections on the removable terminal blocks only after disconnecting them from the unit.

When the control unit is in one of the modes mentioned below, it does not monitor the temperature and the relays are all blocked, the FAULT led start blinking.

- Vis. programming display
- PRG Programming
- Relay test

The ALARM and TRIP relays switch only when the set temperature thresholds are exceeded.

The FAULT contact, programmed in failsafe mode (default YES), opens (11-12) when the equipment is supplied only if the unit detects no fault on switching on, and stays in this condition until one of the following events occurs:

- Data memory fault (Ech message).
- Pt100 sensor fault (FCC short-circuited sensor, FOC interrupted sensor or Fcd quick temperature increase)
- CAL damage to the measurement circuit.
- Insufficient supply voltage.
- During the power on reset after programming (PRG), displaying the data (VIS) and test relay.

The FAULT failsafe can be disabled FAULT selecting failsafe "NO" see step 30-31 programming page 14.

NOTE: do not connect the FAULT relay to the transformer tripping circuit to avoid unwanted system interruptions.

FAULT CONTACT

FAULT 11-12 NC: ALARM FAULT OR POWER OFF

FAULT 11-12 NO: POWER ON OR NO FAULT

The FAN1 and FAN2 contacts can be used to control the cooling fans, or they can be inserted in the conditioning system of the transformer room, see paragraph Fan control on page 17.

NOTE: always disconnect the unit before performing any electrical connections.

FAULT AND RESET MESSAGE SEQUENCE

Find below the sequence of fault messages and RESET function condition.

- | | | |
|-----------|----------------------------|--------------------------|
| 1) ECH | eprom fault | erasable message |
| 2) CAL | measurement circuit fault | erasable message |
| 3) FCD | quick temp. increase fault | resettable condition |
| 4) ERR PT | FCC or FOC sensor fault | non-resettable condition |

PROGRAMMING

NT538 ETH

STEP	PRESS	EFFECT	PRESS	NOTES
1		Keep the PRG key pressed until the display shows PRG SET		
2		Select PRG SET for entering in the programming mode or PRG 1 to restore the default programmed value.	 	PRG 1 default value
3		it is displayed the CH1 activation		YES = CH1 Enable NO = CH1 Disable
4		Select YES or NO	 	
5		The ALARM CH1 threshold for is displayed Set the desired threshold, the Alarm LED flashes		Default 90°C
6		Set the desired threshold	 	
7		The TRIP CH1 threshold for is displayed Set the desired threshold, the Trip LED flashes		Default 119°C
8		Set the desired threshold	 	
9		it is displayed the CH1 FAN activation, FAN1 and FAN2 ARE flashing		info functioning fans : fan control section page 17
10		Select : YES + FAN1 FAN2 enabled flashing YES only FAN1 enabled flashing YES only FAN2 enabled flashing NO LED FAN1- FAN2 off	 	Default YES FAN1+FAN2
11		Repeat the above steps for all channels CH2 - CH8		
12		The display shows ON this indicator flashes FAN1		Default 70°C
13		Set the desired threshold	 	
14		The display shows OFF this indicator flashes FAN1		Default 60°C
15		Set the desired threshold	 	
16		The display shows ON this indicator flashes FAN2		Default 45°C
17		Set the desired threshold	 	
18		The display shows OFF this indicator flashes FAN2		Default 30°C
19		Set the desired threshold	 	

20		HFN (NO) is displayed The FAN1-FAN2 LEDs flash		Fan cyclic test for 5 min. every "n" hours
21		Set the desired number of hours	 	Default NO = function disabled
22		FCD (NO) is displayed		Fault for quick temperature increase (°C/sec)
23		Set the desired value (FCD info on page 31)	 	Default NO (function excluded)
24		VOT (NO) is displayed (VOTING info on page 16)		
25		Select the NO-1-2-3	 	Default NO (function excluded)
26		The display shows FLS (ALARM) Blinking LED ALARM (info FAIL SAFE on page 30)		
27		Select YES or NO	 	Default NO
28		The display shows FLS (TRIP) Blinking LED TRIP		
29		Select YES or NO	 	Default NO
30		The display shows FLS (FAULT) Blinking LED FAULT		
31		Select YES or NO	 	Default YES
32		END is displayed		End of programming
33		Press ENT to save the set data and exit programming		Err: incorrect programming of the LED values (note 6)
34		Return to step 1		

PROGRAMMING NOTES

- 1) The MODE key allows reversing the programming steps according to the sequence 24-22-12-1
- 2) The TEST key allows exiting programming without saving the modified data.
- 3) After 1 minute's keyboard inactivity programming is abandoned without saving the data.
- 4) During programming the control unit does not control/protect the monitored machine.
- 5) At the end of programming the control unit is restarted and the FAULT relay is disabled until the unit is fully restarted.
- 6) If pressing ENT, "Err" appears, it means that one of the following mistakes has been made:

ERR ALL. = ALARM \geq TRIP (CH1-CH2-CH3-CH4-CH5-CH6-CH7-CH8)
ERR FAN = FAN-OFF \geq FAN-ON. (FAN1 OR FAN2)

The device automatically switches to the programming step of the mistake.

NOTE: EVERY TIME THE CONTROL UNIT IS PROGRAMMED WITH DATA SAVING CONFIRMATION, THE VALUES STORED IN T-MAX ARE RESET TO THE TIME OF SAVING.

ATTENTION :

We recommend you check the unit's programming before starting the device.

The default parameters set by TECSYSTEM might not match your requirements.

Programming the device is the end user's responsibility, the settings of the alarm thresholds and the enabling of the functions described in this manual must be checked (by a specialized engineer) according to the application and features of the system the control unit is installed on.

TEMPERATURE SENSORS

Each Pt100 temperature sensor has a white wire and two red (CEI 75.8) , in the figures on page 11 shows the disposition of the in the terminal and connection cables. Each channel can be independently programmed with two alarm thresholds (alarm and trip).

MEASUREMENT SIGNAL TRANSFER

All the cables transferring the Pt100 measurement signals must comply with the following under all circumstances:

1. Every Pt100 must be connected with a three-wire cable having a minimum section of 0.50mm² and a maximum of 1 mm².
2. The extension cable must be screened with tinned copper braid with an 80% cover
3. Conductors must be twisted, maximum recommended step 60mm
4. The cable screening must be grounded only with a termination, preferably on the unit side.
5. The sensors' signal transfer cable must not be near electrical cables, either low or medium-high voltage.
6. The Pt100 cable and the signal transfer cable must be laid in a straight line, without any winding.
7. Any caps used to butt conductors must be crimped properly to avoid false contacts.

NOTE: to install the sensors and signal transferring cable correctly, read the SCS/SENSOR installation rules manual.

What may happen when installation rules are not complied with.

1) The electrical field propagating from the power line of another circuit, couples capacitively with the conductors (in particular with unscreened cables). The effect of this coupling creates a signal that overlaps the signal transmitted by the nearby conductors, causing incorrect readings.

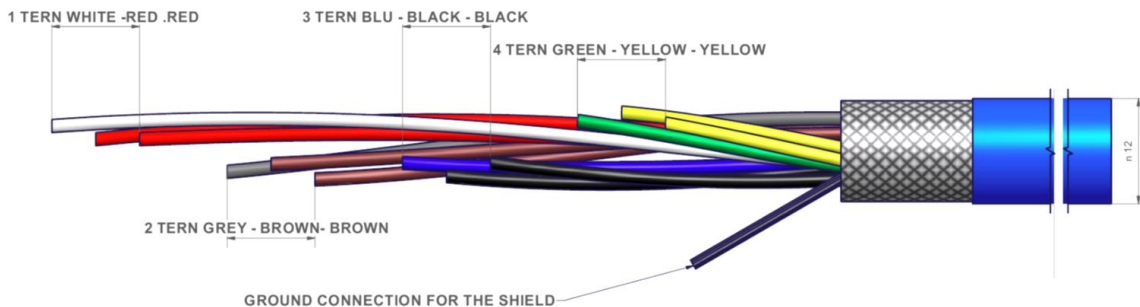

2) The variations in magnetic flux in the power lines may induce an electromotive force on the signal transferring cables (in particular non-twisted cables), that, being a closed circuit, generates a current. This interference current, multiplied by the circuit resistance, gives a voltage value that overlaps the signal to be transmitted, distorting the sensor measurement.

3) False contacts can alter the signal with the consequent variation in the temperature detected.

In specific cases, when the rules for connecting the Pt100 sensors are not complied with, the following anomalies can occur between the SCS box and the temperature control unit:

- a) incorrect temperature readings, alarms or anomalous tripping
- b) mechanical / electrical fault of the Pt100 sensors
- c) damage to the Pt100 inputs of the control unit.

TECSYSTEM S.r.l. has designed its own special cable to transfer the measurement signals, CEI-compliant, with all the protection requirements provided for: model CT-ES

NOTE: the use of cables not complying with the above might cause reading anomalies. It is always important to take into account that any interference on the signal lines might cause anomalies on the Pt100 inputs (CH1-CH2-CH3-CH8...) or on the sensors themselves.

All "NT" series control units have linearity of the sensor signal, with a maximum error of 1% of full scale value.

TEMPERATURE SENSOR DIAGNOSTICS

In case of failure or exceeded full scale value of one of the thermometric sensors installed on the machine to protect, the FAULT relay opens immediately with the relative warning of faulty sensor on the corresponding channel (PT err).

Fcc indicates sensor short-circuited or minimum full scale value of the control unit exceeded -8°C (version 0°÷240°C) and -48°C (version -40°C÷200°C)

Foc indicates sensor interrupted or maximum full scale value of the control unit exceeded 243°C (version 0°÷240°C) and 203°C (version -40°C÷200°C)

To eliminate the message and reset the opening of the Fault contact, it is necessary to check the Pt100 connections and replace the faulty sensor (if any). If the minimum/maximum full scale value has been reached, check that the ambient conditions match the control unit reading.

Note: exceeding the minimum/maximum full scale value can also be caused by interference on the sensor lines; in this case we recommend that you check:

the correct installation of the sensors and above all of the extension cable (as stated in the paragraph MEASUREMENT SIGNAL TRANSFER) the activation of: VOTING (see below) or FCD (see page 31) according to the conditions of the system.

CAL message display: it appears when damage is found in the measurement circuit. The temperature values displayed might be incorrect. Return the control unit to TECSYSTEM for repairs.

VOTING FUNCTION

The voting function is derived from the concept of redundancy which consists of the duplication of components of a system with the intention of increasing **reliability**.

How the **VOTING** works?

Taking advantage of the principle indicated we use the probes installed to monitor the operation of the electrical machine, but at the same time ensure the proper functioning of the probes themselves, discriminating any false alarms (generated by installation errors or failures).

Enabling **VOTING** can be done by choosing one of three modes of selection "1-2-3" the control unit performs a comparison of the temperature values measured on the channels monitored, enables switching of the tripping contact (**TRIP**) only if it is found the overcoming of the TRIP threshold on at least two channels in the same period T.

Selecting **VOTING "NO"** function will be disabled.

In the tables, the selection, indicated below you will find the combination of channels with voting active available. For greater flexibility in two combination we expected channel with voting enabled and others with voting disabled.

- Voting enabled: The contact TRIP switches only if at least two channels exceeded TRIP threshold.
- Voting disabled: The contact switches when the TRIP single-channel exceeds the threshold of TRIP.

Selection 1	Selection 2	Selection 3
VOTING ENABLE CH1.....CH3	VOTING ENABLE CH1 CH6	VOTING ENABLE CH1 CH8
1	1	1
2	2	2
3	3	3
VOTING DISABLE CH4..CH8	4	4
4	5	5
5	6	6
6	VOTING DISABLE CH7..CH8	7
7	7	8
8	8	

Note: The switching of **ALARM** signal still exceeded the threshold of alarm on each channel.

To enable Voting read the programming section on pages 13-14.

Attention: To control the transformer correctly from a temperature point of view, enabling the VOTING function is allowed where the load distributed between the phases of the transformer is adequately balanced. In addition, any conditions of FAULT: FCC-FCC-FCD on two or more channels, with active voting, can determine the TRIP contact inhibition.

PROGRAMMED DATA DIAGNOSTICS

In case of failure of the internal memory or corruption of programmed data, just after switching on, **Ech** appears with the relevant Fault contact.

In this case, for safety reasons, the default parameters are loaded automatically (see programming table on pages 13-14). Eliminate **Ech** by pressing RESET and run programming to enter the desired values.

Finally switch the unit off and back on to check the memory works correctly, if it is damaged **Ech** will be displayed again (send the control unit to TECSYSTEM srl for repairs).

TEMPERATURE DIAGNOSTICS

When one of the temperature sensors senses a temperature 1°C higher than the alarm threshold, 5 seconds later the **ALARM** relay switches and the **ALARM** LED of the affected channel (CH*n*) lights up.

When the trip temperature limit is exceeded, the **TRIP** relay switches and the **TRIP** LED of the affected channel (CH*n*) lights up.

As soon as the recorded temperature returns to values equal to or lower than the limit set for the **ALARM** and **TRIP** relays switching, these relays de-energise and the corresponding LEDs switch off.

The **ALARM** and **TRIP** values are kept in the internal memory: they can be recalled by entering the Vis modes (programmed parameter display) and modified in PRG (programming) mode.

COOLING FAN CONTROL

The unit NT538 ETH has two contacts FAN (FAN1 and FAN2), if properly programmed, can control ON-OFF of fans for cooling system checked.

The high flexibility of the NT538 ETH allows you to select, for each channel, an operation mode for contact management of FAN1 and FAN2. During the programming of the individual channel, enabled, you will be asked to select one of the following ways to activate FAN, dedicated to that channel:

- **YES FAN1 + FAN2 enabled flashing**

The selected channel CH*n*, enable the switching of both contacts FAN1 and FAN2 in relation to thresholds ON - OFF programmed for FAN1 and FAN2.

- **YES only FAN1 enabled flashing**

The selected channel, CH*n*, enable the switching of the contact FAN1 in relation to the threshold ON - OFF programmed to FAN1.

- **YES only FAN2 enabled flashing**

The selected channel, CH*n*, enable the switching of the contact FAN2 in relation to the threshold ON - OFF programmed to FAN2.

- **NO FAN1 + FAN2 flashing Off**

The FAN function on the selected channel, CH*n*, is disabled. The selected channel is not associated with any threshold FAN.

The thresholds FAN1: (ON – OFF) and FAN2: (ON – OFF) are common to all channels CH*n* enabled, programmable to step 12-19 Programming page 13.

FAN1: (eg. At 70 ° C ON - OFF at 60 ° C)

FAN2: (eg. At 45 ° C ON - OFF at 35 ° C)

The values of ON and OFF can be programmed depending on the range of the device, FAN ON must always be greater by at least 1 °C since FAN OFF (recommended Δ FAN POWER ON-OFF + 10 ° C).

The FAN 1 / FAN 2 LED lights up when the temperature exceeds the FAN ON threshold, the corresponding relay switches, and turns off when the temperature goes below the FAN OFF threshold, the corresponding relay switches.

FAN TEST

By programming (**HF*n***), it is possible to have the fans operating 5 minutes every "xxx" hours, regardless of the column or ambient temperature values (i.e.: with HF*n*=001 the fans are activated for 5 minutes every hour).

This function aims at verifying the fan operation and their control apparatus periodically.

By setting **NO** this function is inhibited.

To enable the HF*n* function, read the programming section on pages 13-14.

IMPORTANT WARNING

Before carrying out the isolation test of the electrical panel the control unit is installed on, disconnect it together with the sensors from the power supply to prevent it from being seriously damaged.

ETHERNET MODBUS TCP OUTPUT

INTRODUCTION TO THE ETHERNET MODULE

The Ethernet connectivity of the new NT538 ETH allows you to implement the functions of the Tecsystem control units directly into your monitoring system, with maximum 8 Modbus TCP nodes.

The integrated module includes all the essential network features, among which a 10Base T / 100Base-TX Ethernet connection, TCP / IP full stack suitable to work as Modbus TCP slave.

The unit can be used for remote configuration, monitoring in real time or problem solving.

The Windows-based Telnet system allows configuring the NT538 ETH easily into a sub-network with specific IP addresses.

OPERATING NOTES

The communication of the temperature control monitoring unit is active only when the NT538 ETH is in temperature control mode (Scan, Auto, Man and T.Max).

When other functions such as programming, programming display and relay test are activated, the ModBus communication is temporarily deactivated.

DATA TRANSMISSION

The Ethernet module allows you to connect to the control unit through Modbus TCP slave so that you can: read the data on the Modbus table on page 20 and write those in the paragraph regarding the remote programming notes.

The ETH module is always in slave mode.

The NT538 ETH control unit is in communication with the network only when it is in temperature reading mode, while it is inactive when in the following modes: display, programming and relay test.

NOTES ON ETHERNET ELECTRICAL CONNECTIONS

As to the signal cable to use in order to guarantee correct operation, it is necessary to use a CAT 7 Ethernet cable with RJ45 connector with the following specifications:

- > 4 twisted pairs 23AWG
- > Tinned copper braid with an 80% cover.
- > Always position the Ethernet cable far from power cables.

FUNCTION CODE

The ModBus module supports the following function codes:

3₍₁₀₎: - holding register reading

16₍₁₀₎: - register multiple writing

If ModBus receives a message and a CRC error is detected, no answer is given.

CODE 3₍₁₀₎

Request:

Slave address, code 3₍₁₀₎, Starting address HI, Starting address LO, Number of Point HI, Number of Point LO, Crc LO, Crc HI.

Answer:

Slave address, code 3₍₁₀₎, Byte count, Data HI, Data LO....., Crc LO, Crc HI.

CODE 16₍₁₀₎

Request:

Slave address, code 16₍₁₀₎, Starting address HI, Starting address LO, Number of Point HI, Number of Point LO, Byte count, Data HI, Data LO....., Crc LO, Crc HI.

Answer:

Slave address, code 16₍₁₀₎, Starting address HI, Starting address LO, Number of Register HI, Number of register LO, Crc LO, Crc HI.

NOTES FOR REMOTE PROGRAMMING

The writable registers are shown in TABLE MODBUS MAPPING referred to as W or RW (**write or read / write**) max number of registers 72, see table page. 20.

In the case in which the channel is not enabled and / or the information is not provided we have the following answers:

1. Temperatures measured = 0000 (0 ° C)
2. Temperatures AL. / TRP = value written in E2PROM
3. Channel status = 0000
4. Setting channel =% 00000000, xxxxxx0% (x = na)

If WRITE data must always respect the rule T_trip> T_alarm and FAN_ON> FAN_OFF.

In case you try to set these thresholds incorrectly, the control unit NT538 ETH will not proceed with the programming and storage of data, therefore in subsequent readings will read the data from the previous schedule.

After having sent a request for writing the control unit will take a time of about 1 " to store the data in eeprom, during the step of storing the module ModBus will not be able to process additional requests.

If the demand for programming is successful, the unit automatically resets and loads the new settings.

In the event that information is sent in writing to a register can't be written (only READ) data will be trashed without affecting the received message.

The information "RELAY STATUS" indicates the state of excitation of the coils of the relays, so it will be subject to the commands of "FAIL SAFE".

From the point of view of the control unit Modbus connection is considered as a normal NT538.

At the end of the write command (Write) is carried out a check of compatibility data:

- If you have a non-compatibility "exception" for an answer and the data packet is rejected in its entirety. The code of the first erroneous data can be obtained by reading the log "Error received data" (Note: this code is lost during RESET or new power or writing data in E2PROM);
- if the data are correct, they are transferred to the non-volatile memory (E2PROM), resets the historical data (Tmax = 0 ° C) and is subsequently forced a reset of the system
- If the WRITE command implies only writing "CONTROL" it will be implemented autonomously and without RESET, ie without affecting the data of the control unit.

ERROR CODES (exception codes)

In case of a wrong request, ModBus will answer with modified codes and codified errors according to the following:

- 1: - Unsupported function code
- 2: - Wrong data address
- 3: - Wrong data (for instance length)

The memory area containing the HFN datum must undergo no forcing.

In the case in which all the fans are turned off (F1, F2) the test of the relay will not take place.

GENERAL UNIT NOTE

The models of the unit can be equipped with different options ; to avoid disruption of production , their existence is defined by Fw indicated power , with messages dedicated on display LEDs .

This information can be accessed by reading the Modbus register 6 (options) with the following meaning :

LOW Byte

Bit_1 = Ethernet

HIGH Byte

Bit_0/1 = 00 - Range 0°C ÷ 240°C

Bit_0/1 = 10 - Range -40°C ÷ 200°C

In case of Ethernet option Modbus and 4.20mA mode shall not be active on the display. They will be readable from the log.

Note: in case the values programmed from ModBus are out of range, it will generate a "exemption" error response to date.

ILLEGAL DATA

On the other hand, some combinations are programming errors because they are wrong settings; in this case the error code is ILLEGAL_DATA. This information is accessible to ModBus reading the register 7.

NO ERROR		No error 00
CH_1 Trip ≤ Alarm		Code error 01
CH_2 Trip ≤ Alarm		Code error 02
CH_3 Trip ≤ Alarm		Code error 03
CH_4 Trip ≤ Alarm		Code error 04
CH_5 Trip ≤ Alarm		Code error 05
CH_6 Trip ≤ Alarm		Code error 06
CH_7 Trip ≤ Alarm		Code error 07
CH_8 Trip ≤ Alarm		Code error 08
FAN_1 ON ≤ OFF		Code error 017
FAN_2 ON ≤ OFF		Code error 018
No channels enabled		Code error 019
Value HFN > max	see table: SYSTEM - Setting and Status	Code error 020
Value FCD > max	see table: SYSTEM - Setting and Status	Code error 021
Value 4.20 > max	see table: SYSTEM - Setting and Status	Code error 022
Value Voting > max	see table: SYSTEM - Setting and Status	Code error 023
Voting wrong function (channels not enabled)		Code error 024

Note. If the value of Voting is higher than the max value expected for the model in question, it will be set equal to "0", that is NO_VOTING.

FREQUENCY OF QUESTION (Polling).

It is advisable to adopt polling frequencies greater than or equal to 1 second.
Questions frequently can overload the system, without bringing any benefit.

ETHERNET MODULE PROGRAMMING PARAMETER

X Windows Vista, 7, 8.

ETH0 CONNECTIONS

Using an Ethernet cable, connect the RJ45 ETH0 of the NT538 ETH control unit to the ethernet card of a PC.

TELNET ENABLING

Use the Telnet program to set the Ethernet IP parameters.

1) START menu (Windows)

If already enabled, the program appears

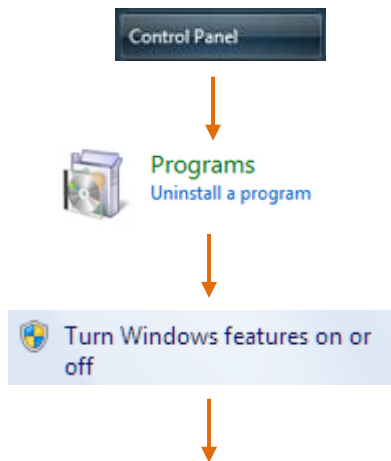

2) Start the search with the Telnet program
Entering telnet in SEARCH.

Press ENTER to launch the program.
(Go to step 12 on page 27)

If the Telnet program is not enabled:

3) START menu (Windows):

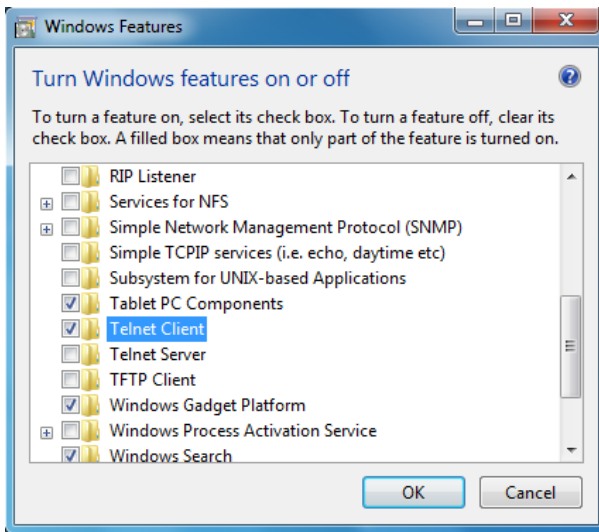

4) Select Control panel

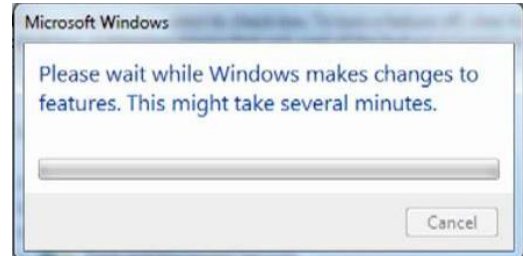

5) Select Programs, followed by Features or Programs and Features

6) Select Turn Windows features on or off

7) Enable Telnet Client and click "OK"

The screen below will open.
Wait for the Telnet function to activate.

8) Close the open screens and restart the PC if required

9) START menu (Windows)

10) Search for the Telnet program

11) Press ENTER to launch the program

12) TELNET SCREEN

13) Enter: OPEN

14) Press ENTER

15) Enter: 192.168.10.120 9999

16) Press ENTER

17) Enter the Password: TECS

18) Press ENTER

Note: In this screen we have the **MAC address** and the **software** version of the ETH port available.

19) IP PARAMETER PROGRAMMING MENU

```
Telnet 192.168.10.120
Modbus/TCP to RTU Bridge
MAC address 0080A3A71806
Software version U3.3.0.5 <140827> XPTC
Password :----
Press Enter for Setup Mode

Model: Device Server Plus+! <Firmware Code:YM>

Modbus/TCP to RTU Bridge Setup
1) Network/IP Settings:
   IP Address ..... 192.168.10.120
   Default Gateway ..... 192.168.10.1
   Netmask ..... 255.255.255.0
   Telnet config password set
2) Serial & Mode Settings:
   Protocol ..... Modbus/RTU,Slave(s) attached
   Serial Interface ..... 19200,8,E,1,RS485
3) Modem/Configurable Pin Settings:
   CP1 ..... RS485 Output Enable
   CP2 ..... Not Used
   CP3 ..... Not Used
4) Advanced Modbus Protocol settings:
   Slave Addr/Unit Id Source .. Modbus/TCP header
   Modbus Serial Broadcasts ... Disabled <Id=0 auto-mapped to 1>
   MB/TCP Exception Codes .... Yes <return 00AH and 00BH>
   Char. Message Timeout ..... 00050msec, 05000msec
7) Security Settings:
   SNMP ..... Enabled
   SNMP Community Name ..... public

   Port 77F0h ..... Enabled

D)default settings, S)ave, Q)uit without save
Select Command or parameter set <1..7> to change: _
```

IP PARAMETER PROGRAMMING MENU (TELNET)

The TELNET menu allows you to modify the configuration parameters of the Ethernet port.

The information available to you is:

Parameters that can be modified by the operator

- 1) Parameter modification (IP Address - Gateway- Netmask -Telnet password).

Parameters that cannot be modified by the operator

- 2) Communication parameters between the ETH0 port and the control unit.
- 3) Communication configuration between the ETH0 port and the control unit.
- 4) Communication advanced settings between the ETH0 port and the control unit.
- 7) Security settings between the ETH0 port and the control unit.

IMPORTANT WARNING

For the device to work correctly, we advise you not to access or modify menus 2-3-4-7. The modification of the values in the stated menus might cause communication anomalies with the loss of the Ethernet IP communication.

MENU MODIFICATION PROCEDURE 1) IP parameters:

enter the command: 1

```
IP Address: IP Address <192> 192.<168> 168.<010> .<120> 120_
```

1) Enter the desired new IP address, if you wish to keep the set address press ENTER 4 times.

- At the end of the operation, the system will ask if you wish to modify the Gateway IP:

```
IP Address <192> 192.<168> 168.<010> .<120> 120  
Set Gateway IP Address <N> ?
```

Enter: **Y** to modify the Gateway IP.

N not to modify the Gateway IP and go to the following step.

2) Enter the desired new Gateway IP address, press ENTER; if you wish to keep the set address press ENTER 4 times.

```
IP Address <192> 192.<168> 168.<010> .<120> 120  
Set Gateway IP Address <N> ? Y  
Gateway IP Address : <192> 192.<168> 168.<010> 10.<001> 001_
```

- At the end of the operation, the system will ask if you wish to modify Netmask:

```
IP Address <192> 192.<168> 168.<010> .<120> 120  
Set Gateway IP Address <N> ? Y  
Gateway IP Address : <192> 192.<168> 168.<010> 10.<001> 001  
Set Netmask <N for default> <N> ?
```

Enter: **Y** to modify Netmask.

N not to modify Netmask and go to the following step.

3) Enter the new Netmask, press ENTER; if you wish to keep the set address press ENTER 4 times.

```
IP Address <192> 192.<168> 168.<010> .<120> 120  
Set Gateway IP Address <N> ? Y  
Gateway IP Address : <192> 192.<168> 168.<010> 10.<001> 001  
Set Netmask <N for default> <N> ? Y  
<255> .<255> .<255> .<000> _
```

- At the end of the operation, the system will ask if you wish to modify the Telnet Password:

```
IP Address <192> 192.<168> 168.<010> .<120> 120  
Set Gateway IP Address <N> ? Y  
Gateway IP Address : <192> 192.<168> 168.<010> 10.<001> 001  
Set Netmask <N for default> <N> ? Y  
<255> .<255> .<255> .<000>  
Change telnet config password <N> ? _
```

Enter: **Y** to modify the Telnet Password.

N not to modify the Telnet Password and go to the following step.

```
IP Address <192> 192.<168> 168.<010> .<120> 120
Set Gateway IP Address <N> ? Y
Gateway IP Address : <192> 192.<168> 168.<010> 10.<001> 001
Set Netmask <N for default> <N> ? Y
<255> .<255> .<255> .<000>
Change telnet config password <N> ? Y
Enter new Password:
```

4) Enter the new Telnet Password (4 digits max), press ENTER; if you wish to keep the set Password, press ENTER.

```
D>default settings, S>ave, Q>uit without save
Select Command or parameter set (1..?) to change: _
```

Enter: S to save the modified data.
Q to exit Telnet without saving the data.

The following screen will be displayed:

```
→ D>default settings, S>ave, Q>uit without save
Select Command or parameter set (1..?) to change:
Parameters saved, Restarting ...
```

To check the programmed parameters or repeat programming, follow the TELNET SCREEN from step 12 to step 19, page 27.

Indications of LEDs 1-2 of the Ethernet port:

LED 1: Link		LED 2: Activity	
➤ Off	= No link	➤ Off	= No Activity
➤ Amber	= 10 Mbps	➤ Amber	= Half Duplex
➤ Green	= 100 Mbps	➤ Green	= Full Duplex

FAIL SAFE FUNCTION

The NT538 ETH has n.o selection (contact open) / n.c (normally closed contact) for ALARM, TRIP and FAULT relays, programming steps 26 to 31 page 14. The selection of the setting YES/NO introduces functions Fail Safe and No Fail Safe.

ALARM AND TRIP

Setting NO (NO Fail safe) normally open contacts are in positions 5-7 Alarm and 8-10 Trip, they switch only when limits are reached preset temperature.

Setting YES (Fail Safe) normally closed contacts are in positions 5-7 Alarm and 8-10 Trip, they switch only when limits are reached preset temperature.

FAULT

Setting YES (Fail safe) the contact 11-12 is positioned as normally open, switches (closed) when a fault condition is identified; see section on page 12 alarms and ventilation.

Setting NO (NO Fail safe) the contact 11-12 is positioned as normally closed, switches (open) when a fault condition is identified; see section on page 12 alarms and ventilation.

Disabling the failsafe function on the fault contact, the unit will no longer be able to report the fault for lack of power. In this case it is suggested that the enabling of the fail safe on the ALARM contact for the above indication.

NOTE: When the unit is located in one of the methods described below does not monitor heat, also the relay will all be banned, the FAULT led start blinking.

- Vis. display programming.
- PRG programming.
- Test of the relays.

The FAIL SAFE is temporarily disabled The FAULT relay switches.

Pt100 EXTENSION CABLE TECHNICAL SPECIFICATIONS

1. Cable 20 x AWG 20/19 Cu/Sn
2. Section 0.55 mm²
3. Flame retardant insulation PVC105
4. CEI 20.35 IEC 332.1 regulations
5. Maximum operating temperature: 90°C
6. Conformation: 4 sets of three twisted and coloured conductors
7. Shield in Cu/Sn
8. Flame retardant PVC sheath
9. External diameter 12mm
10. Standard conformation in 100m coils

FCD FUNCTION

The NT series equipment boasts an innovative control function combined with the dynamic status of the Pt100 sensor.

Activating FCD, the control unit analyses the increase in temperature ΔT (*) recorded in a second (**°C/sec**).

Enabling the function, the user can select the value (ΔT) from a minimum of 1°C/sec to a maximum of 30°C/ sec. If the value sensed is higher than the value set by the user, the control unit inhibits the possible activation of the ALARM and TRIP alarms and switches the FAULT relay (11-12), displaying the message "**Fcd fault**".

Example: if we set the function to 5°C, FAULT will switch for FCD only if the control unit senses an increase in ΔT of over 5°C in a second on the monitored system.

Setting "no" disables the FCD function.

When a channel is in FAULT for FCD, the relative Alarm and Trip warnings are inhibited; therefore only the over-quick temperature increase is highlighted.

Press Reset to delete the FCD warnings on all channels and reset the FAULT relay.

Possible FCD applications

Identification of a possible induced interference on the Pt100 sensor line

If the installation instructions are not complied with (see page 15), any interference on the Pt100 sensor line can cause false readings or anomalous alarms.

Setting the FCD function in a temperature range of between 1°C and 10°C (5°C recommended), the effects caused by false readings can be suppressed and the alarm relay activation can be prevented, as shown above.

Corrective actions: check the installation of the sensor extension cable is in line with the instructions given in the paragraph on the measurement signal transfer on page 15.

Identification of a sensor fault or faulty connection

In case of a faulty connection or sensor fault, a quick positive or negative variation in temperature might occur, leading to the system tripping or the alarms of the monitored system to be triggered.

In this specific case we recommend the FCD function to be set in a temperature range of between 10°C and 20°C.

Corrective actions: check the terminals the sensor is connected to are tightened and replace the faulty sensor, if required.

Identification of the electrical motor rotor block

In case of temperature control of the electrical motors, the quick temperature increase might be due to a blocked rotor.

In this specific case we recommend the FCD function to be set in a temperature range of between 20°C and 30°C. This setting is recommended in order to prevent the FCD function from activating during motor start-up, or where the ΔT /sec. increase varies quickly.

(*) The ΔT value shows the temperature range for each second.

NOTE: you should not enable the FCD function with active VOTING.

WARRANTY CONDITIONS

The Product purchased is covered by the manufacturer's or seller's warranty at the terms and conditions set forth in the "Tecsystem s.r.l.'s General Conditions of Sale", available at www.tecsystem.it and / or purchase agreement.

The warranty is considered valid only when the product is damaged by causes attributable to TECSYSTEM srl, such as manufacturing or components defects.

The warranty is invalid if the Product proves to have been tampered with / modified or incorrectly connected and causing voltages outside the set limits and does not comply with the technical data for use and assembly, as described in this instruction manual.

The warranty is always ex Corsico as stated in the "General Conditions of Sale".

TROUBLESHOOTING	CAUSES AND SOLUTIONS
The control unit does not switch on and the supply to terminals 40-42 is correct.	Check that: the connector is correctly inserted into its housing, the wires are tightened, there is no evidence of burning on the connectors. Disconnect the power supply, carry out the above and reconnect.
FOC FAULT on CHn	Programming error of the CHn / YES control unit. <i>Check and repeat programming as per page 13-14, select CHn / NO.</i>
One of the three/four channels is in FAULT due to FOC/FCC	Check the connections of the Pt100 sensors, check the instructions given in the paragraphs: <i>measurement signal transfer and temperature sensor diagnostics on page 15-16.</i>
When turning on, the display shows "ECH"	Strong interference damaged the stored data. See the paragraph Programmed data diagnostics on page 17.
All the PT100 sensors are in FCC.	Incorrect sensor connection, the terminal block has been inserted upside down. <i>Check the connections and the terminal board.</i>
The temperature shown by one or more channels is wrong.	Contact the <i>TECSYSTEM Technical Department.</i>
Sudden trip of the main switch. The temperature is on standard levels. Just one channel has caused the trip.	Check the temperatures recorded in T-MAX, check the instructions given in the paragraphs: <i>measurement signal transfer and temperature sensor diagnostics on page 15-16. Activate the FCD function.</i>
FCD warning	See the FCD function on page 31.
Contact <i>TECSYSTEM Technical Department</i> if the problem persists.	

EQUIPMENT DISPOSAL

European directives 2012/19/EC (WEEE) and 2011/65/EC (RoHS) have been approved to reduce electrical and electronic waste and promote the recycling and reuse of the materials and components of said equipment, cutting down on the disposal of the residues and harmful components of electrical and electronic materials.

All the electrical and electronic equipment supplied after 13 August 2005 is marked with this symbol, pursuant to European directive 2002/96/EEC on electrical and electronic waste (WEEE). Any electrical or electronic equipment marked with this symbol must be disposed of separately from normal domestic waste.

Returning used electrical devices: contact TECSYSTEM or your TECSYSTEM agent for information on the correct disposal of the devices.

TECSYSTEM is aware of the impact its products have on the environment and asks its customers active support in the correct and environmentally-friendly disposal of its devices.

UL SPECIFICATION AND RATINGS

CABLE SPECIFICATION	Dimension for main circuit 18AWG, working temperature over 105°C
MASS OF THE EQUIPMENT	0,45 Kg
INPUT SUPPLY	100– 240 Vac / Vdc ($\pm 10\%$), 50/60 Hz, 7,5VA max
PROTECTION	External switch or circuit breaker
OUTPUTS RELAYS	5 relay Output: 10A 250Vac-res COS=1
PORT	Ethernet

Suitable for use on a flat surface of a type 1 enclosure if back panel is provided with two short fixing screws tightening torque : 0.57Nm
